Why do we decide to use PP-Films?

A large number of customers opt for PP films due to the contribution this product can make to the preservation of nature and the environment for future generations.

The declared goal behind this idea is to ensure environmental sustainability through the use of PVC-free materials.

The raw material polypropylene (PP) is considered an environmentally friendly alternative, as it is a simply structured synthetic material, which is a "by-product" in gasoline production.

This resource is used sensibly by us in the form of protective films.

The positive arguments for the use of products containing PP speak for themselves:

- **PVC-free**
- **non-toxic combustion**
- **does not contaminate ground water**
- **virtually shrink-proof**
- **available in various thicknesses**
- **available with various different degrees of gloss and with different structures**
- **UV protection**
- **temperature resistant up to +100°C (212°F)**
